By the WoundSource Editors Whether due to injury or surgery, wound healing normally progresses steadily through an orderly set of stages. Wounds that don't heal within 30 days are considered chronic. Wounds that become chronic generally stall in one or more of the phases of wound healing. Here are 10 of the most common factors affecting wound healing in chronic wounds:

Factors Affecting Wound Healing in Chronic Wounds ...

The wound may include undermining and tunneling, and may have slough or eschar present. Bone and muscle are visible and directly palpable in these wounds. Category/stage IV pressure ulcer depth varies by location on the body. These wounds can extend into muscle and other supporting structure, increasing the occurrence of osteomyelitis or osteitis.

Scars are visible signs that remain after
a wound has healed. They are the
unavoidable results of injury or surgery,
and their development can be
unpredictable. Poor healing may
contribute to scars that are obvious,
unsightly or disfiguring. Even a wound
that heals well can result in a scar that
affects your appearance.
